COVID-19 Coronavirus Total Ab

BRL

Non-Reactive

Test method: Roche Elecsys

A non-reactive (i.e. negative) result indicates undetectable levels of antibody against SARS-CoV-2. False negative results may occur due to individual variability in immune response, or if tested in early infection. This assay in principle can detect high affinity antibodies of all isotypes (i.e. IgG, IgA and IgM).

Antibody results alone should not be used to infer infectious status.
